

Even with regular caregiver visits, families often worry about what happens when no one is there.

Lifeguard provides an added layer of awareness inside the home by monitoring activity patterns and identifying meaningful changes that may indicate something needs attention.

It helps families feel more confident that their loved one is safe while continuing to live independently at home.

What Lifeguard Helps Families With

Knowing When Something May Be Wrong

Lifeguard learns normal daily routines and can detect meaningful changes in activity, sleep, hygiene and nutrition. Care teams can review these changes and check in when needed.

Supporting Safe Independence

Many older adults want to remain in their own homes as they age. Lifeguard adds an extra layer of protection while allowing them to continue living independently.

Providing Peace of Mind for Families

Families gain reassurance knowing that patterns in the home are being monitored and that potential concerns may be identified sooner.

Privacy Comes First

Lifeguard is designed to respect the privacy and dignity of the person living in the home.

- No cameras
- No microphones
- No wearable devices

The system simply analyzes changes in Wi-Fi signals caused by movement in the home to understand activity patterns.

A Simple System

Small devices are placed in key areas of the home and connect through a secure hub. Over time, Lifeguard learns normal routines and can identify changes that may require attention.

If something unusual is detected, care professionals can review the information and determine whether a follow-up is needed.

Lifeguard helps families feel more confident that their loved ones are safe, supported, and able to remain at home longer.
